

POLAR COORDINATES: Seeking a Distance and an Angle

[Buy Now at New England Laser & Transit Click to Purchase](#)

It is convenient at times to locate points on a jobsite by turning a certain angle along a known line and measuring a distance from the instrument to the desired point. The example below is used in the explanation of Rectangular Coordinates, as used in Total Station layout. Point 1 is 40' along one axis and then offset 20' at 90°. Using a Transit and tape measure (or the stadia feature in a Transit), Point 1 can be located by turning an angle of 26.6° and measuring out 44.72'. For those fluent with trigonometry, a tangent calculation and Pythagorean Theorem exercise will obtain the desired angle and distance. For the rest of us, an inexpensive Scientific Calculator will solve the problem nicely. In selecting a Calculator, be sure the instrument converts **Rectangular**→**Polar Coordinates** and also **Decimal Degrees**→**DegreesMinutesSeconds**.

Various calculators will have slightly different sequences to obtain Polar Coordinates (i.e. angle & distance). Having access to a Texas Instrument TI-30x, the key strokes are as follows

Rectangular to Polar

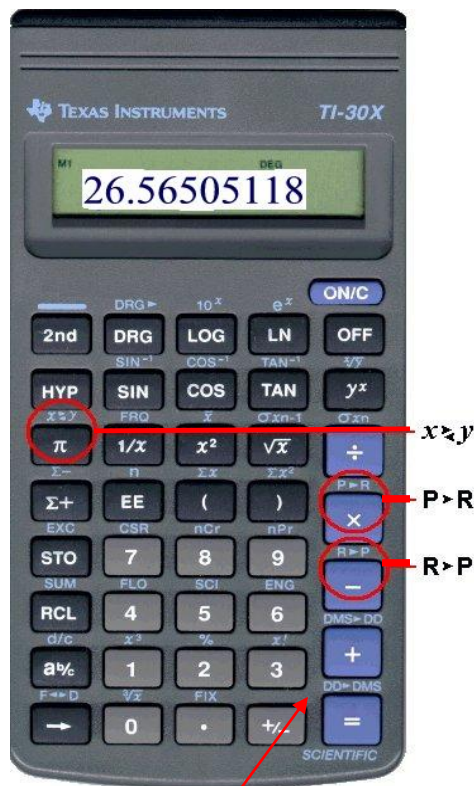

2^{nd} [R>P] converts rectangular coordinates (x,y) to polar coordinates (r,θ) .

Convert rectangular coordinates $(40,20)$ to polar.

40 2^{nd} [x=y] 20 DEG 20

2^{nd} [R>P] (display r) DEG r 44.7213595

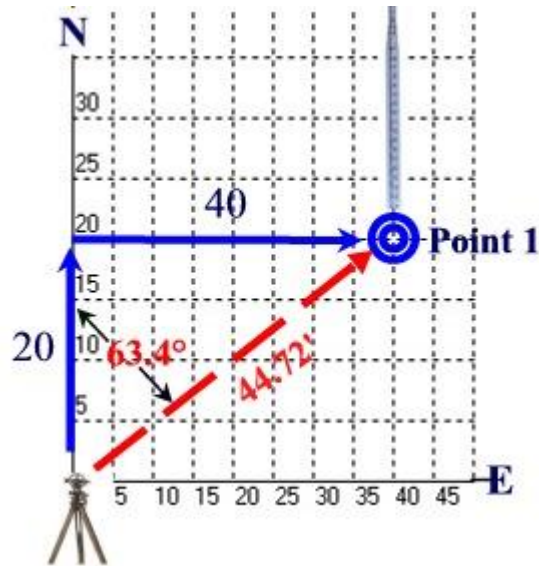

2^{nd} [x=y] (display θ) DEG 26.56505118

DD►DMS

With 26.56505118 displayed as a Decimal Degree, by choosing 2^{nd} function and DD►DMS a reading of 26°33'54" will be displayed.

To use N/E instead of X/Y, such as shown:

the results would be the following:

Rectangular to Polar

$\boxed{2\text{nd}} \boxed{[R \rightarrow P]}$ converts rectangular coordinates (x,y) to polar coordinates (r,θ) .

Convert rectangular coordinates(20,40)to polar.

20 $\boxed{2\text{nd}} \boxed{[x \div y]}$ 40	DEG	40
$\boxed{2\text{nd}} \boxed{[R \rightarrow P]}$ (display r)	DEG r	44.7213595
$\boxed{2\text{nd}} \boxed{[x \div y]}$ (display θ)	DEG	63.4349488

With 63.4349488 displayed as a Decimal Degree, by choosing 2^{nd} function and **DD** \blacktriangleright **DMS** a reading of **63°26'05"** will be displayed.
